sporting a mix of blue yellow white green and black the unmistakable blue tit reflects the colours of a planet affected by a burgeoning human population fortunately blue tits are adapting well to modern humanity taking advantage of our propensity to feed birds in our gardens and provide boxes for them to nest in in turn this feisty little species provides an excellent model for biological research this book is the result of a personal quest by author martyn stenning to bring together a range of discoveries into one accessible volume the blue tit begins by inviting readers into the intimate lives of these birds as they attempt to reproduce describing the many challenges they face when rearing their offspring the story moves on to the fluid state of blue tit classification across the native palearctic range before progressing into population structure lifetime ecology and an exploration of factors that determine breeding success it culminates with an in depth look at research over the years followed by a selection of personal anecdotes and an overview of blue tit appearances in folklore and poetry this book provides a definitive record of the biology and ecology of one of our most popular intelligent and charismatic birds

today s biodiversity is the spectacular product of hundreds of millions of years of evolution understanding how this diversity of living organisms appeared is one of the most intriguing and challenging question in biology because organismal morphology is established during embryonic development and because morphological traits diversified from ancestral forms during evolution it can be inferred that changes in the mechanisms controlling embryonic development are instrumental for morphological evolution this syllogism lies at the very heart of a new discipline called evo devo which is centered in the identification of the cellular and genetic mechanisms that through modifications in developmental programmes were at the base of morphological innovations during evolution after the discovery of the broad conservation of gene content and regulatory networks in the animal kingdom as well as in plants evo devo is orienting towards the study of differences through experimental and functional approaches given the

wide range of species gene families and developmental processes considered a concerted effort is still required to shed light on the genetic cellular and molecular mechanisms involved in phenotypic evolution it is a particularly exciting time for this field of evolutionary developmental biology as the advent of novel imaging genome editing and sequencing technologies allows the study of almost any organism in ways that were unthinkable only a few years ago therefore the aim of this frontiers research topic is to gather an original collection of experimental approaches concepts and hypotheses reflecting the current diversity of the evo devo field we have organized the articles according to the mechanistic depth with which they tackle specific evolutionary issues hence comparisons of expression patterns have been grouped in chapter 1 changes in regulatory interactions and gene networks are presented in chapter 2 while chapter 3 focuses on the evolution of developmental processes and biological patterns
